29

## 30 **Executive summary**

31 This paper aims at providing a guidance to the EU/EEA regulatory medicines network on when and how  
32 to use specific adverse reaction follow-up questionnaires (Specific AR FUQs) in routine  
33 pharmacovigilance activities.

34 The completeness of information in Individual Case Safety Reports (ICSRs) is essential in many  
35 pharmacovigilance assessments. However, the information available in these reports is often limited  
36 and may lack essential data that would allow for better characterisation of the reported adverse  
37 reactions. To address this issue, forms and questionnaires are commonly used to collect additional  
38 information when initial reports are incomplete. These include general follow-up questionnaires (FUQ)  
39 and Specific AR FUQs.

40 This paper provides guidance on the use of Specific AR FUQs and focuses on Specific AR FUQs  
41 developed by the MAHs at the request of NCAs and does not intend to modify the MAHs internal  
42 policies for FUQs. It emphasizes the importance of obtaining structured and detailed information on  
43 reported adverse reactions that may impact the benefit-risk balance of a product or have implications  
44 for public health.

45 The document identifies three main directions: providing general guidance on when and how to use  
46 Specific AR FUQs, guidance for MAHs on developing Specific AR FUQs, and considering discontinuation  
47 and removal of Specific AR FUQs.

48 The guidance outlines the requirements for a Specific AR FUQ and recommends that a Specific AR FUQ  
49 should be used for safety concerns that may impact the benefit-risk balance of a product. For  
50 important identified risks listed in the product information, FUQs should not be generally used, but in  
51 some special situations, a Specific AR FUQ may be necessary for further characterization of the risk.

52 The content of a Specific AR FUQ should focus on collecting the missing data of main importance for  
53 assessing the safety concerns in question and should be prefilled with available information to avoid  
54 requesting the primary source to repeat information. A Specific AR FUQ should not be extensive and its  
55 completion by the reporter should be easy to minimize the burden on reporters and to avoid  
56 discouraging future spontaneous reporting.

57 The format and dissemination of Specific AR FUQs should follow existing recommendations to optimize  
58 data collection. This includes having a common structure and contain a preface, basic content, and  
59 specific content with questions addressing essential aspects of the adverse reaction. The MAHs are not  
60 expected to use Specific AR FUQ for case reports that are not initially and directly sent to them (e.g.,  
61 cases reported to NCAs or other MAHs).

62 To facilitate knowledge sharing, a tool is being developed to list and publish approved Specific AR  
63 FUQs.

64 Overall, in addition to existing GVP guidelines, this guidance provides a framework for the use and  
65 implementation of Specific AR FUQs as part of risk management in routine pharmacovigilance activities  
66 to improve the completeness of information in pharmacovigilance.

67

## 68 **1. Introduction (background)**

69 The completeness of information in Individual Case Safety Reports (ICSRs) is essential in  
70 pharmacovigilance assessments. However, the information available in the ICSRs is sometimes limited  
71 and may not always provide important information that would allow to better characterise the adverse  
72 reaction (AR) reported.

73 Forms and questionnaires are used to collect additional information as part of routine  
74 pharmacovigilance when information in initial reports is incomplete. These include general follow-up  
75 questionnaires (e.g., for pregnancy exposure to medicinal products) or companies' internal check lists  
76 that are used to collect more data on spontaneous reports or Specific Adverse Reaction Follow-up  
77 questionnaires (Specific AR FUQs) which aim to obtain standardised, structured, and detailed  
78 information from the reporter on a particular AR.

79 For general FUQs, the existing guidelines and the requirements from the **GVP Module VI** apply, e.g., for  
80 pregnancy FUQ, EMA's guideline on the exposure to medicinal products during pregnancy<sup>1</sup> or for  
81 medication errors<sup>2</sup>.

82

## 83 **2. Scope**

84 To facilitate completeness of initial information, Specific AR FUQ refers to FUQs that are deemed  
85 necessary to obtain structured and detailed information on reported adverse reactions (ARs) that may  
86 have an impact on the benefit risk balance of the product or have implications for public health.

87 The scope of this guidance is limited to specific (or targeted) AR FUQs requested by the competent  
88 authorities. It does not intend to modify or change the MAHs' internal policy for FUQs.

89 The MAH is not expected to collect further information about a case report that is not initially and  
90 directly sent to them (e.g., cases reported to NCAs or other MAHs)<sup>3</sup>.

91 Three main directions have been identified for the present document:

- 92 • Providing general guidance (when and how to use Specific AR FUQs) to competent authorities in  
93 Member States (NCAs), Pharmacovigilance risk assessment committee (PRAC), pharmacovigilance  
94 and clinical assessors, pharmacovigilance (GVP) inspectors, Marketing authorisation holders  
95 (MAHs) and the European Medicines Agency (EMA), using the opportunity of ongoing EMA work on  
96 updates of GVP guidelines
- 97 • Developing guidance that can be used by MAHs and recommend if and how approved Specific AR  
98 FUQs could be published
- 99 • Considerations on discontinuation and removal of Specific AR FUQs

100

## 101 **3. Legal basis**

102 This guideline should be read in conjunction with all relevant information included in current and future  
103 EU guidelines based on the Directive 2001/83/EC [DIR] and Regulation (EC) No 726/2004 [REG], and  
104 ICH guidelines and regulations, especially:

- 105 • Guideline on good pharmacovigilance practices (GVP) Module V – Risk management systems
- 106 • Guideline on good pharmacovigilance practices (GVP) Module VI – Collection, management, and  
107 submission of reports of suspected adverse reactions to medicinal products
- 108 • Guideline on good pharmacovigilance practices (GVP) Module VII – Periodic safety update report

115

## 116 **4. Guidance on the use of the Specific AR FUQ**

### 117 **4.1. Requirements for a Specific AR FUQ**

118 Adverse reactions for which Specific AR FUQs are considered can be defined as those referring to  
119 safety concerns<sup>4</sup> (from RMP and/or PSUR) for which the collection of information as detailed as  
120 possible and their better characterisation may have an impact on the B/R balance of the medicinal  
121 product.

122 For medicinal products requiring a Specific AR FUQ but without an RMP in place (exceptional and/or for  
123 old products), the Specific AR FUQ could be associated to a safety concern identified and/or followed-  
124 up in the PSUR.

125 If there is a RMP already in place, the (new) Specific AR FUQ referring to the relevant safety concern  
126 should be included into the RMP (annex 4).

127 As Specific AR FUQs are related to safety concerns which could impact the benefit/risk balance of a  
128 medicinal product, the number of situations requiring such questionnaires is expected to be limited. For  
129 important identified risks which are listed in the product information as undesirable effects (section 4.8  
130 of the SmPC) and for which a frequency has been determined above 1/1000<sup>5</sup>, Specific AR FUQs should  
131 in principle not be used because the burden for Healthcare Professionals would be significant. However,  
132 in some special situations, where the reversibility, severity or other aspects of the important identified  
133 risk need to be further characterised, a Specific AR FUQ might be necessary.

134 When assessing whether a Specific AR FUQ should be recommended, consideration should be given to  
135 other tools in place which collect more data on the same risk (e.g., PASS) and to what extent a  
136 Specific AR FUQ would be of additional value.

137 Specific AR FUQs are considered as routine pharmacovigilance.

138 Specific AR FUQs used by different applicants/MAHs (including for generics) for the same adverse  
139 reaction should be kept as similar as possible. MAHs are strongly encouraged to share the content of  
140 their questionnaire(s) upon request from other MAHs.<sup>6</sup>

### 141 **4.2. Content of the Specific AR FUQ: aspects to be considered**

142 Specific AR FUQs should focus on the collection of missing data of particular importance which were not  
143 initially provided by the reporter.

144 The Specific AR FUQ should be prefilled by the MAH with all the available information collected at the  
145 time of the initial report, to limit the burden on the reporters.

---

<sup>4</sup> Important identified risk, important potential risk and missing information

<sup>5</sup> i.e. very common ( $\geq 1/10$ ); common ( $\geq 1/100$  to  $< 1/10$ ); uncommon ( $\geq 1/1,000$  to  $< 1/100$ )

<sup>6</sup> [https://www.ema.europa.eu/en/documents/scientific-guideline/guideline-good-pharmacovigilance-practices-module-v-risk-management-systems-rev-2\\_en.pdf](https://www.ema.europa.eu/en/documents/scientific-guideline/guideline-good-pharmacovigilance-practices-module-v-risk-management-systems-rev-2_en.pdf)

146 Additional questions should be strictly limited to the collection of standardised information and detailed  
147 information on a particular adverse reaction to better characterise a safety concern.

148 In line with **GVP Module VI**, the length of the Specific AR FUQ should be as short as possible.

149 This guidance proposes a common structure of Specific AR FUQ which should be used and adapted to  
150 fit within existing MAH and NCA practices. These Specific AR FUQs should contain three parts:

- 151 • A preface to explain the added value of this Specific AR FUQ (to increase the willingness of  
152 reporters to complete the Specific AR FUQ and thus provide relevant additional information) e.g.,  
153 *"You have reported an adverse reaction(s) of XXXX for "medicinal product name". This*  
154 *questionnaire is being sent to you for obtaining valuable additional information about the reported*  
155 *case to thoroughly evaluate the relation to "medicinal product name" exposure. The questionnaire*  
156 *is already prefilled with all the available information collected at the time of the initial report, only*  
157 *additional information should be filled in. By providing as detailed information as possible, you can*  
158 *make a useful contribution to the safety of "medicinal product name".*
- 159 • A basic content (such as the patient age, gender, dates of drug intake, date of adverse reaction  
160 occurrence / resolution, outcome, medical history, concomitant medications).
- 161 • A specific content with questions covering essential aspects to be considered (i.e., detailed data on  
162 the adverse reaction) to allow the characterisation of an adverse reaction and/or assessment of the  
163 causality between the adverse reaction and the medicinal product. The aspects to be considered  
164 should be identified when the need for this Specific AR FUQ emerges and should display the  
165 minimum content of information usually lacking but nevertheless essential to perform a causality  
166 assessment and a better characterisation of the adverse reaction. They could address the following  
167 points (but not limited to):
  - 168 – Context of use (including the exact therapeutic indication),
  - 169 – Risk factors related to the specific adverse reaction,
  - 170 – Clinical/biological data including specific laboratory values (reference values should be asked  
171 for where relevant), histopathological results, imaging data, or any other relevant data (e.g.,  
172 autopsy investigations in case of fatal outcome), that enable either the confirmation of the  
173 adverse reaction or exclusion of other causes.

174 Regarding the approval of the content of the Specific AR FUQ, it is worth noting that the **GVP Module V**  
175 on the format of the risk management plan (RMP) in the EU provides the following guidance for  
176 Specific AR FUQs: *"should be described in the routine pharmacovigilance activities section and copies*  
177 *of these forms should be provided in RMP annex 4".* (see **GVP Module V**, Section V.B.6.1.1) Therefore,  
178 Specific AR FUQs within an RMP usually require a review of the exact content by the competent  
179 authorities. However, the depth of review may differ depending on e.g., the type of procedure or  
180 pharmacological considerations and may be limited to a consistency check.

181 Caution should be applied when choosing the name of the Specific AR FUQ, to fit with MedDRA terms  
182 and to avoid terms at SOC level or vague medical concepts that could be considered too broad to  
183 characterise a safety concern.

### 184 **4.3. Format of the Specific AR FUQ**

185 In general, the format, content and layout of the Specific AR FUQ should follow recommendations from  
186 **GVP Module V** and **GVP Module VI** to optimise collection of the missing information. Specific AR FUQs  
187 should use:

- 188 • Tick boxes where possible, to save time of the reporter.

189 • At least one free text field to enable responders to provide any additional information.  
190 It is the responsibility of the MAHs to ensure that submitted Specific AR FUQs are readable and  
191 understandable by the responders with a content as short as possible. The review of the Specific AR  
192 FUQ could involve panel experts in the field of the (physio-)pathology and adverse reaction of interest.

193 Specific AR FUQs should be sent by the MAHs to the reporters in the local language of the reporter.  
194 The translations in local languages are the responsibility of the MAHs.

#### 195 **4.4 Dissemination of the Specific AR FUQ**

196 The dissemination of Specific AR FUQ to Reporters is performed by the MAHs for suspected adverse  
197 reactions reports received directly to them.

198 The tools used for the dissemination can include different means like emails, web-based  
199 questionnaires, apps, phone, mail, fax, and letters. Reminders should always be included, and their  
200 timing should be defined<sup>7</sup>.

201

### 202 **5. Publishing of Specific AR FUQ**

203 To share the existing Specific AR FUQs in place, a tool is being developed by the EMA to list and  
204 publish (annex 4 and/or full RMP) Specific AR FUQs approved by competent authorities and covered  
205 ([link to the tool when available](#)) by the scope of this guidance.

206 To simplify the collection and search of existing Specific AR FUQ, the heading of the Specific AR FUQ  
207 should be titled with the name of the medicinal product and the MedDRA term best reflecting the  
208 underlying safety concern.

209

### 210 **6. Considerations on discontinuation and removal of Specific** 211 **AR FUQ**

212 Characterisation of risks through use of Specific AR FUQ might become necessary at any time  
213 throughout the lifespan of a medicinal product and should be discontinued when the safety concern has  
214 been sufficiently characterised.

215 The MAHs should ensure that the Specific AR FUQs are implemented in an effective and timely manner.

216 The MAHs are encouraged to regularly assess the effectiveness of the Specific AR FUQs, using process  
217 and outcome indicators:

218 • **Process indicators** (e.g., a response rate) can be used to monitor whether the targeted recipients  
219 (to be detailed by the MAHs) of the Specific AR FUQs respond to the request for more information.  
220 While process indicators cannot provide evidence on whether a Specific AR FUQ is effective, a low  
221 response rate should trigger further analysis. For instance, a low response rate could be related to  
222 the questionnaires not reaching the target (i.e., the reporter of the adverse reaction), the request  
223 not being identified as important by the target, an inadequate format or collection means, a lack of  
224 readability, or complex response process.

225 • **Outcome indicators** (e.g., details about the specific information collected after the  
226 implementation of the specific AR FUQ). Competent authorities may request to the MAHs to provide  
227 a detailed analysis of the additional information provided and to substantiate how it contributes  
228 both to increase the quality of the data collected when compared with the initial information and to

---

<sup>7</sup> GVP VI.B.7.1. (Submission time frames of ICSRs)

229 a better characterisation of the safety concern with a potential impact on the benefit/risk balance  
230 of the medicine. The outcome indicators should reflect the added value of the information collected  
231 compared to what already existed in the initial ICSR.

232 Effectiveness results should be submitted upon request of the competent authorities in a procedural  
233 framework (e.g., PSUR, RMP update).

234 Discontinuation and removal of a Specific AR FUQ in light of the characterisation of the safety concerns  
235 over time can be considered when a Specific AR FUQ is assessed as successful, for example led to  
236 reclassification of an important potential risk as an important identified risk or a as a non- important  
237 risk (i.e. that would not warrant to be followed up through a safety concern in the RMP) or led to the  
238 conclusion that there is no causal association based on the additional information reported and the  
239 important potential risk can be removed from the RMP and/or PSUR.

240

## 241 **Definitions and abbreviations**

242 **Specific Adverse Reaction Follow-up questionnaires (Specific AR FUQs):** Questionnaires which  
243 aim is to obtain standardised, structured, and detailed information on reported suspected adverse  
244 reactions of special interest and go beyond general follow-up questionnaires.

245 **B/R** – Benefit/Risk

246 **ADR reporting** – Adverse drug reaction reporting

247 **AR** – Adverse reaction (synonyms: Adverse drug reaction (ADR), Suspected adverse (drug) reaction,  
248 Adverse effect, Undesirable effect)

249 **EMA** – European Medicines Agency

250 **FUQ** – Follow-up questionnaire

251 **GVP** – Good pharmacovigilance practices

252 **HCP** – Healthcare professional

253 **ICSR** – Individual case safety report

254 **MAH** – Marketing authorisation holder

255 **MedDRA** – Medical Dictionary for Regulatory Activities

256 **NCA** - National competent authority

257 **PASS** – Post-authorisation safety study

258 **PRAC** – Pharmacovigilance risk assessment committee

259 **PSUR** – Periodic safety update report

260 **RM** – Risk management

261 **RMP** – Risk management plan

262 **SmPC** – Summary of product characteristics

263 **SOC** – System organ class

264 **Specific AR FUQ** – Specific adverse reaction follow-up questionnaire
