Submission of comments on 'Preliminary QIG Considerations regarding Pharmaceutical Process Models'

Fields marked with * are mandatory.

* Question: Name of organisation or individual EFPIA

* Question: Country of organisation or individual

Belgium

* Question: Email

kateryna.khmilevska@efpia.eu

If you respond on behalf of an organization, please allocate yourself a name abbreviation to be used as "Stakeholder name" in the comment tables below. If you comment as an individual, please ignore this field and use your full name as your "Stakeholder name".

EFPIA

1. General comments on the 'Preliminary QIG Considerations regarding Pharmaceutical Process Models' Consolidated comments – read this section only

| | Stakeholder name | General comment |
|---|------------------|--|
| 1 | EFPIA | The document gives much clarity on the current expectations of the QIG and seems to represent an expansion of the ICH Q8-10 "Points to Consider" document (section on modeling), with more details added. For clarification on this comparison, is the change of terminology in model classifications from "model impact" to "model risk" intentional or are the three categories meant to of identical categorization? This is particularly relevant as there are a few areas where the QIG preliminary considerations document represents additional or sometimes tighter/more conservative interpretations, for example around "medium risk" models where the document remains very conservative in its approach to medium impact models. Another example is the use of process models only used for product or process design, which in the ICH document generally land in the "low" category but in this document could be "medium". Medium risk models trigger additional activities (potential maintenance protocols) which seem not applicable for development models. A missing elements seems to be the risk or impact of the model in context with the overall control strategy, where the overall risk could be reduced to the context. Could there for example be a high impact model with medium or low risk to the quality of the product? |
| 2 | EFPIA | Beyond the relationship to the ICH Points to Consider document, the categorization of process models (table 1) implies that all process models need to be registered. There could be scenarios especially in the post-approval setting where process models are used for pure process monitoring only, with no connection to control strategy, or resulting actions (digital twin in shadow mode?). The prevalent current practice in the industry would be to not register such applications, but rather completely manage them in the PQS. It would be valuable to also define a "no risk" category or define in the scope of the document that there can be cases where no dossier registration is required, otherwise the |

| - | | |
|----------|-------|--|
| | | unintended consequence of the document would be disincentive to use |
| <u> </u> | | such models because of registration and life cycle burden. |
| 3 | EFPIA | From the perspective of harmonization of expectations for process model |
| | | at least with the FDA, it would be desirable understand the perspective of |
| | | the QIG to the ASME methodology applied around "context of use" and |
| | | "risk management". The current document has a number of places where |
| | | the terminology or the concepts of the ASME V&V 40 standard are used |
| | | or applied, without being named as such, however without the greater |
| | | context on model risk that the ASME standard applies. An incomplete |
| | | application of the ASME or any other more complete model risk and – |
| | | robustness methodology would lead to potential misalignment and |
| | | hurdles to acceptance and application. |
| 4 | EFPIA | One item of concern and potential hurdle to adoption is that already for |
| | | medium-impact models potentially a significant amount of detailed |
| | | information that is managed by the PQS/GMP framework (Q3 and 4 |
| | | answers) needs to be submitted in the dossier. This includes, depending |
| | | on the circumstances, "model maintenance protocol" line 233, "method |
| | | verification protocol line 208 (analogue to "Design Space verification |
| | | protocol"), "continuous model verification protocol" line 220. It is |
| | | generally a hurdle to submit detailed information about PQS procedures |
| | | in registration dossier, due to the potential chances in PQS procedures |
| | | which would trigger variation filings. This approach has in the past already |
| | | slowed down adoption of NIR spectroscopy and Design Spaces due to the |
| | | link between PQS and registration changes. Suggest to have further |
| | | reflection on the roles and responsibilities between assessment and |
| | | inspection for process models. |
| 5 | EFPIA | In a number of sections, new or previously unused terminology is chosen, |
| | | expl. line 177 "validity domain" table 1 QA= Quality Attribute (as opposed |
| | | to CQA). It is suggested to add a glossary to provide clarity about the |
| | | definitions or offer cross-references to existing sources for definitions. |
| | | This includes the use of the terminology of "process model validation" vs. |
| | | *process model verification" or whether the QIG wants to give details on |
| | | what types of process models require formal validation (expl. process |
| | | models used for product development, low impact) |
| | | Another consideration is to expand on the abbreviated examples in table |
| | | 1 and give more elaborate examples how models would end up in certain |
| | | categories, or how models, depending on the use, could transition |
| | | between different categories (expl. Process models for process |
| | | development) |
| | | |

2. Specific comments on text

| 2.1. Ba | ackground |
|---------|-----------|
|---------|-----------|

| 2 | | | | | | |
|---|-------------------|------------------------|-----------------------|------------------------|--|--|
| | Line number(s) of | Stakeholder name | Comment and rationale | Proposed guidance text | | |
| | the relevant text | (to be repeated in all | | | | |
| | (e.g. 20-23) | rows) | | | | |
| | | | | | | |

2.2 Introduction

| | Line number(s) of the relevant text (e.g. 20-23) | Stakeholder name (to be repeated in all rows) | Comment and rationale | Proposed guidance text |
|---|--|---|--|---|
| 1 | 27 | EFPIA | Add use of process models for scale-up | Proposed text: The expected outcome from the use of process models is enhanced |

| | | | | process understanding, (multivariate) monitoring and control, robustness, performance and adaptability including at different scales / configurations. |
|---|-------|-------|--|--|
| 2 | 28-30 | EFPIA | Models used for predictive approaches are missing | performance, adaptability, forecasting and predictive control |
| 3 | 32 | EFPIA | Add "chemical", as this is equally relevant | physical, chemical or biological process or system. |
| 4 | 35 | EFPIA | The 3 different types of models (scientific distinction) are given but there is no further use of the distinction in the rest of the document, for example different expectations for development, validation, extrapolation etc. | Two solutions are proposed: 1) If there is no clear connection to regulatory expectations suggest to remove the classifications. of L36-L40. 2) If the idea is to keep the model types, then we suggest making it clear that: "All three model categories are in scope" |
| 5 | 40 | EFPIA | Definition of "hybrid models" is missing | Define Hybrid models as a combination of mechanistic and data- driven |
| 6 | 41 | EFPIA | The use of process models for process controls is missing. | Expand to with "process control" |

2.3 Scope

| | Line number | Stakeholder name | Comment and | Proposed guidance text / element of |
|---|-------------|--------------------|--------------------------|--------------------------------------|
| | of text | (to be repeated in | rationale | the figure |
| | | all rows) | | |
| 1 | 48-49 | EFPIA | Suggest to use | |
| | | | consistent language | |
| | | | around the types of | |
| | | | models, aligned with | |
| | | | the definitions in lines | |
| | | | 35-40. Semi-empirical | |
| | | | models appear to be | |
| | | | missing in lines 48-49. | |
| 2 | 51-56 | EFPIA | A further clarification | We recommend updating the scope |
| | | | on applicability and | to include AI models. While we think |
| | | | terminology around | that the draft guidance would cover |
| | | | Machine Learning vs | AI models as is, including specific |
| | | | artificial intelligence | guidance on AI models would also be |
| | | | models is desirable in | beneficial |
| | | | this document. Please | |
| | | | clarify what is defined | |

| as ML model but not | |
|-------------------------|--|
| as an Al model. This is | |
| with respect to the | |
| | |
| potentially different | |
| risk postures outlined | |
| in the EU AI Act | |
| definition (AI has an | |
| element of autonomy | |
| in decision making) vs. | |
| machine learning | |
| models as empirically | |
| developed models. | |

| Q1. How should the risk to product quality be considered when determining what data is to be included in |
|--|
| the dossier in terms of model justification? |

| | Line number(s) of the relevant text (e.g. 20-23) | Stakeholder name (to be repeated in all rows) | Comment and rationale | Proposed guidance text |
|---|--|---|--|---|
| 1 | 57-59 | EFPIA | The term "risk of product quality" is used in the question while "model risk" is used in the answer. If these terms are considered interchangably, it would be better to make it clear or choose one term for consistency. | |
| 2 | 60-61 | EFPIA | It is assumed that models a.) for fate of impurities for DS processes and b.) process purge models for genotoxic impurities/nitrosamines are not in scope of this document. | Fate of impurities for DS processes and process purge models for genotoxic impurities/nitrosamines are not in scope of this document. |
| 3 | 69-74 | EFPIA | The logic applied here is similar or identical to the ASME V&V 40 standard applied by the FDA for process models, however with less context. it is suggested to formally reference the ASME V&V 40 to provide that context or add significant details to the two dimensions of risk. The term "additional monitoring" also would require further clarification, does this refer scenarios outlined in table 1 (additional tests in parallel) or a more "process monitoring" i.e. for continuous | |

| | | | improvement or stage 2 | |
|---|-------|-------|---|---|
| | | | improvement or stage 3 PPQ, | |
| 4 | 71-74 | EFPIA | It is unclear how the manufacturing mode impacts the model risk. | We recommend discussing how these factors impact the risk of the model. |
| 5 | 75-77 | EFPIA | It is unclear the need or the benefit of considering the model in isolation. This is counter to the guidance of ASME VVUQ40 that starts with an assessment of the model's context of use as the primary input to the model's risk assessment. | We recommend deleting this text. |
| 6 | 79 | EFPIA | The term "intended use" is mostly referred as "context of use" in other references (FDA, ASME). | We suggest to use a consistent terminology with existing standards (like ASME V&V40). Change "intended use" to "context of use". |
| 7 | 78-81 | EFPIA | The paragraph is unclear. The model risk assessment should consider the use of the model across the lifecycle of the medicinal product to determine the level of data to be included in the dossier and the degree of regulatory oversight. | We recommend revising this paragraph to consider the use of the model across the lifecycle of the medicinal product to determine the level of data required. |
| 8 | 82-84 | EFPIA | This strongly suggests that all model risk evaluations should be included in the dossier, including models of low-medium risk. It is also not clear if this represents a separate or new type of documentation. Typically a formal risk assessment would be part of the model development and if applicable documentation, so this would be an element of the documentation submitted about the model. Alternatively, like all elements of the control strategy, the model would be risk assessed as part of the overall control strategy and the documentation of the | We recommend the following revision: "The evaluation of model risk <u>and</u> <u>consequence(s) on the</u> <u>overall medicinal</u> <u>product benefit/risk</u> <u>balance- including risks</u> of failure of the model or risks arising from its incorrect use, and their consequence(s) on the overall medicinal product benefit/risk <u>balance</u> , should be discussed in the dossier only for high-risk <u>models. Documentation</u> of medium or low risk <u>models should be</u> <u>maintained in the PQS.</u> " |

| | 97.90 | FEDIA | control strategy (for example in the development section of the dossier) would be including the process model aspects. Similarly, risks arising from an incorrect use of a technology are usually not discussed in the dossier. Mistakes in operating a technology (human error) are subject to control via the manufacturer's GMP quality system. This requirement should be deleted from the document. | We recommend the |
|----|-------|-------|---|--|
| 9 | 87-89 | EFPIA | Documentation beyond the evaluation of model risk (for high-risk models only) should be maintained in the PQS, and not reported in the dossier. | We recommend the following revision: "The evaluation of the risk associated with implementation of a process model is the basis for any justification for inclusion of model related information in the <u>PQS</u> dossier (e.g., model description, justification, validation data)." |
| 10 | 90 | EFPIA | The terms "primary control strategy" and "secondary role" are not clear. Further explanation / definition should be added. | We cannot propose a new guidance text as it is unclear to us what it means. |

Q2. What data is expected in the dossier in terms of model description and scope?

| | Line number(s) of the relevant text (e.g. 20- 23) | Stakeholder name (to be repeated in all rows) | Comment and rationale | Proposed guidance text |
|---|---|---|---|--|
| 1 | 95-97 | EFPIA | Propose to use "product quality" instead of "material quality" | The level of detail regarding the model development and its description in the regulatory submission is dependent on the intended use of the model, its role in the control strategy, and |

| | | | | the risk to material |
|---|------------------------|-------|---|---|
| | | | | product quality. |
| 2 | 95-98 | EFPIA | The level of detail regarding the model development and its description should be maintained in the PQS. | We recommend that model risk assessments will be reported in the dossier for high-risk models only. |
| 3 | 103-117 and 118-134 | EFPIA | The differences to the chapter 5.4 of ICHQ8/Q9/Q10 should be clarified (here or in later sections) The concepts of Model Description and Model Scope are unclear/ overlapped. The expectations for medium and high risk differ in the sections model description and model scope. This should be aligned. | Suggest the two sections are combined and the term "scope" is dropped to align with other EMA and ICH guidance where this term isn't needed for other process controls. Focus on what is part of the dossier description of the model, the assumptions and the scope of this document for applicability, and which of these elements are supportive info and which are ECs or "binding information in dossier" |
| 4 | 111 | EFPIA | Why are literature sources only relevant for mechanistic models? | |
| 5 | 112-113 | EFPIA | Please define "complex". Does this conversely mean that non- complex data need to be submitted? Please clarify in the document. | We cannot propose a new guidance text as it is unclear to me what it means. An example would be useful. |
| 6 | 131-133 | EFPIA | In line 106-117, it is described that performance metrics and model validity domain need to be provided only for high-risk models and not for medium-risk models. This is in contrast to the text provided in line 131-133 where this is required also for medium-risk models. | Propose; "the acceptance criteria for relevant performance metrics (e.g., prediction accuracy, model uncertainty), (for high-risk models only) the model validity domain (for high-risk models only), and |

Q3. What data is expected to be included in the dossier in terms of model validation?

| Q3. Wh | hat data is expected to be included in the dossier in terms of model validation? | | | |
|--------|--|------------------------|--|---|
| | Line number(s) of | Stakeholder name | Comment and rationale | Proposed guidance text |
| | the relevant text | (to be repeated in all | | |
| | (e.g. 20-23) | rows) | | |
| 1 | Line 137 | EFPIA | Validation is not an appropriate term for what is described for low | Change to model "validation/verification" |
| | | | impact models. The term "verification" is used on other EMA guidance (eg for design space) | |
| 2 | 154 (Table 1) | EFPIA | Examples for low impact models are not clear and dossier requirements are not aligned with descriptions for dossier requirements in Q2, where no validation data are requested; | |
| 3 | 154 (Table 1) | EFPIA | The risk levels (low, medium, high) are not defined, except for examples in Table 1. | We recommend defining each risk level or including references to prior publications. |
| 4 | 164-166 | EFPIA | It should read CQA instead of QA. (according to Table 1, QA is considered low risk and CQA is considered medium risk) | Models which influence the process control design in that manner and are used to support batch release decisions predicting CQA(s) (e.g., granulation endpoint) are usually medium risk. |
| 5 | 169 | EFPIA | Implies that any model use to determine the control for a CQA is medium impact regardless of the overall control strategy. Such considerations are a significant disincentive to the use of models I the control strategy. Any system where there the control of the CQAs impacted by the model via end product testing makes the model inherently low risk, regardless of the sophistication of the model. | Revise the table |
| 6 | 189-191 | EFPIA | Multiple ideas are being combined in this sentence like edge of failure, applicability range (already in 133), and robustness. This could be made clearer | "Robustness and edge of failure scenarios should be discussed, as applicable" |

| - | 1 | 1 | 1 | |
|----|---------|-------|-------------------------------|-----------------------------|
| 7 | 198-201 | EFPIA | The connection between | |
| | | | model validation and | |
| | | | process validation is not | |
| | | | clear, or what the | |
| | | | expectations are. In any | |
| | | | scenario process | |
| | | | validation data would be | |
| | | | expected for commercial | |
| | | | processes, but model | |
| | | | - | |
| | | | adequacy can be shown | |
| | | | independent (and prior) to | |
| | | | process validation. To an | |
| | | | extent this is similar to the | |
| | | | concept of analytical | |
| | | | method validation (= | |
| | | | adequacy) which shows | |
| | | | analytical methods and | |
| | | | controls are supportive of | |
| | | | demonstrating process | |
| | | | control including in the | |
| | | | process validation | |
| | | | exercise. | |
| 8 | 198-199 | EFPIA | This sentence reads a bit | Remove lines 198-199 |
| Ů | 100 100 | | in contradiction for low- | |
| | | | risk models as described in | |
| | | | lines 125-126, 160 | |
| 9 | 208 | EFPIA | | |
| 9 | 208 | EFPIA | If needed, a procedure to | |
| | | | ensure validity of the | |
| | | | model at the full scale | |
| | | | should be inherent in the | |
| | | | PQS but not part of the | |
| | | | dossier. Otherwise this | |
| | | | sets a precedent which | |
| | | | would require alleviation | |
| | | | of life cycle burden | |
| | | | through elements of for | |
| | | | example ICH Q12 or | |
| | | | Q2/Q14 for life cycle | |
| | | | management. | |
| 10 | 202 211 | EFPIA | No clear definition of | Please consider adding a |
| | | | model validation vs | definition of these terms. |
| | | | verification | |
| | | | | For example, below are |
| | | | | the descriptions in the |
| | | | | ASME V&V20 standard: |
| | | | | |
| | | | | Verification: |
| | | | | "In general, code |
| | | | | verification assesses |
| | | | | code correctness and |
| | | | | |
| | | | | specifically involves error |
| | | | | evaluation for a known |
| | | | | solution. By contrast, |
| | | | | solution verification5 |
| | | | | involves error |
| 1 | 1 | | | estimation, since the |

| 11 202 211 EFPIA Clarification of validity of models should be mentioned here Missing guidance on developing models at a simulation." 11 202 211 EFPIA Clarification of validity of models should be mentioned here Missing guidance on developing models at a simulation. | 12 | 202-211 | EFPIA | The paragraph does not mention how the transferability between scales differs between | We recommend that the Q&A described this information. |
|---|----|---------|-------|--|--|
| unknown. Code and solution verification are mathematical activities, with no concern whatsoever for the agreement of the simulation model results with physical data from experiments; that is the concern of validation." Validation: "The estimation of a range within which the simulation modeling error lies is a primary objective of the validation process and is accomplished by comparing a simulation result (solution) with an appropriate experimental result (data) for specified validation variables at a specified set of conditions. There can be no validation without experimental data with which to compare the | 11 | 202 211 | EFPIA | models combining data from different locations and scales should be added. Also data coming from DoE studies should be mentioned here Missing guidance on developing models at laboratory scale on a <u>gualified</u> small scale model, would the perception of risk be different and no model verification protocol at commercial scale be | |
| | | | | | solution verification are mathematical activities, with no concern whatsoever for the agreement of the simulation model results with physical data from experiments; that is the concern of validation." Validation: "The estimation of a range within which the simulation modeling error lies is a primary objective of the validation process and is accomplished by comparing a simulation result (solution) with an appropriate experimental result (data) for specified validation variables at a specified set of conditions. There can be no validation without experimental data with which to compare the |

| | | | mechanistic and data driven models. | |
|----|---|-------|---|--|
| 13 | (lines 208, 220) and Q4 (line 233) | EFPIA | Expectations are unclear concerning: · Model verification protocol · Continuous model verification protocol · Model maintenance protocol. | See also general comment #4: It is suggested to keep these in the PQS not dossier. If anything, established guidances should be used (Questions and answers on post approval change management protocols (europa.eu)) vs creating new expectations. |

Q4. What data is expected in the dossier in terms of process model lifecycle?

| | Line number(s) of | Stakeholder name | Comment and rationale | Proposed guidance text |
|---|-------------------|------------------------|---|--|
| | the relevant text | (to be repeated in all | | |
| | (e.g. 20-23) | rows) | | |
| 1 | 233-237 | EFPIA | Model Maintenance Protocol: is this the already known Post Approval Change Management Protocol for submitted models, in which is assessed the different changes that a model can experience during its lifecycle? If yes, then should be considered to include Post Approval Change Management Protocol instead of Model | See also general comment #4: It is suggested to keep these in the PQS not dossier. If anything, established guidances should be used (Questions and answers on post approval change management protocols (europa.eu)) vs creating new expectations. |
| 2 | 233 | EFPIA | Maintenance Protocol In Q-IWG Points to consider for Q8\Q9\Q10 guidelines (europa.eu) section 5.4 Documentation of Model- Related information, medium- impact models do not mention model verification during lifecycle. | Recommendation to align Q-IWG Points to consider for Q8\Q9\Q10 guidelines (europa.eu) concerning medium- impact models. |
| 3 | 245-247 | EFPIA | In line 106-117, it is described that performance metrics need to be provided only for high-risk models and not for medium-risk models. This is in contrast to the text provided in line 245- 247 where this is required also for medium-risk models. | Therefore, the list of performance metrics and acceptance criteria to be followed and checked when a model change occurs (e.g., accuracy, control charts on residuals, etc.), should also be included in the protocol (for high- risk models only). |
